UNDERSTANDING ADFS

Active Directory Federation Services (ADFS) is a software component developed by Microsoft Corporation that provides users with single sign-on access to systems and applications located across organizational boundaries.

This means that the same login information (name and password), used to authenticate for authorization to access local district applications will be used to authenticate for authorization to access State Department of Education (SDE) applications. This also means that the district manages account logins and passwords for access to the SDE applications, rather than the SDE.

New users in Districts set up with ADFS do not need to register a username and password with the SDE. Instead, they will use their district-provided username and login to access authorized SDE applications.

This checklist provides a separate list for each scenario.
